Arquitectura a seguir en el proyecto

A continuación, en base a esta arquitectura procederemos a unir las partes de SQL Server y Mongo DB para la elaboración de proyecto 2.

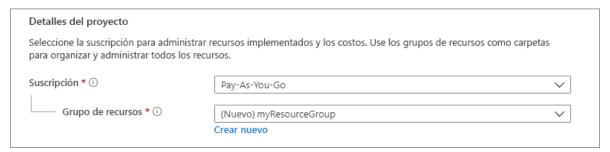

Cada uno de los 3 "servidores" debe ser una máquina física o una máquina virtual diferente.

IMDB Base de Datos Creando Servidor

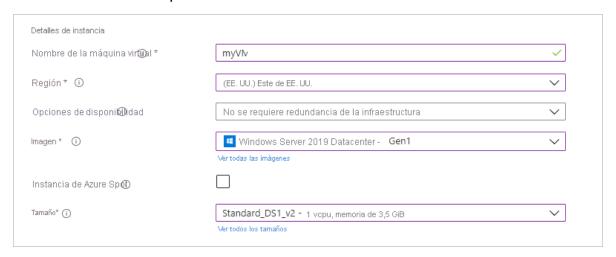

Para iniciar debemos de crear una cuenta en Microsoft Azure, recuerda que cada vez que creas una cuenta podras tener un gasto de 200\$, de uso por un tiempo determinado.

Pasos para crear una maquina virtual

- 1. Escriba máquinas virtuales en el cuadro de búsqueda.
- 2. En Servicios, seleccione Máguinas virtuales.
- 3. En la página Máquinas virtuales, seleccione Crear y, luego, Máquina virtual. Se abrirá la página Creación de una máquina virtual.
- 4. En la pestaña Aspectos básicos, en Detalles del proyecto, asegúrese de que esté seleccionada la suscripción correcta y luego elija Crear nuevo grupo de recursos. Escriba myResourceGroup como nombre.

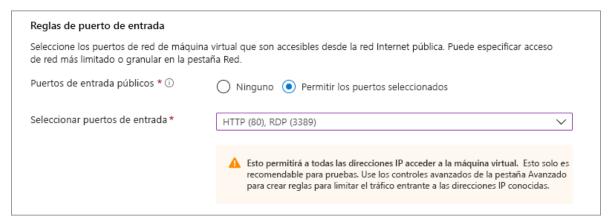

5. En Detalles de instancia, escriba myVM en Nombre de máquina virtual y elija Windows Server 2019 Datacenter - Gen2 para la Imagen. Deje los demás valores predeterminados.

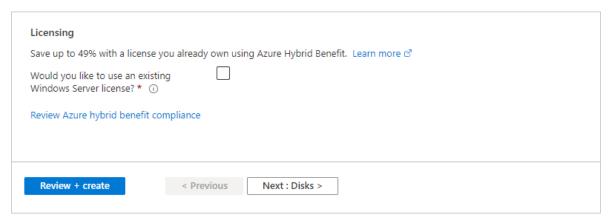

6. En Cuenta de administrador, proporcione un nombre de usuario, como azureuser, y una contraseña. La contraseña debe tener al menos 12 caracteres de largo y cumplir con los requisitos de complejidad definidos.

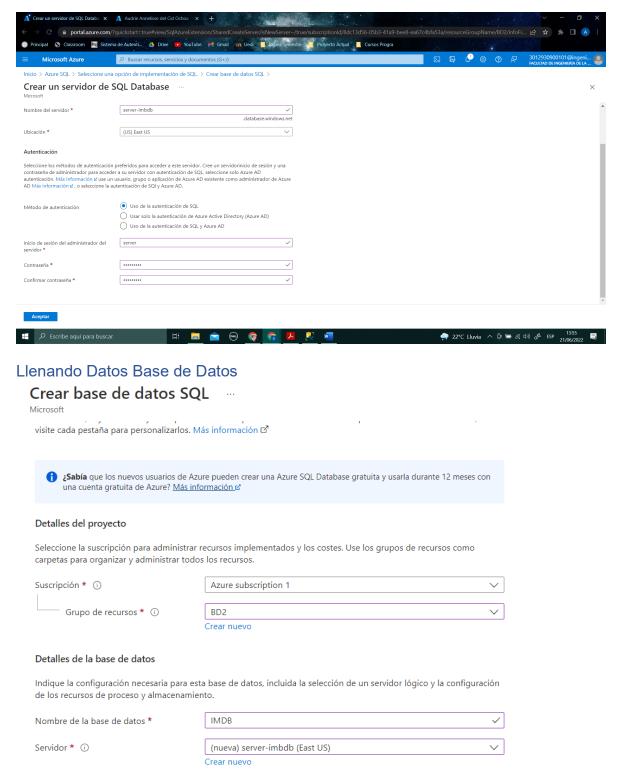

7. En Reglas de puerto de entrada, elija Permitir los puertos seleccionados y luego seleccione RDP (3389) y HTTP (80) en la lista desplegable.

8. Deje los valores predeterminados restantes y luego seleccione el botón Revisar + crear en la parte inferior de la página.

A continuación mostramos los pasos, sin embargo para este caso usaremos un servidor de SQL para proceder a crear la base de datos de IMDB.

Configuramos opción de implementación

Detalles del proyecto Seleccione la suscripción para administrar recursos implementados y los costes. Use los grupos de recursos como carpetas para organizar y administrar todos los recursos. Suscripción * ① Azure subscription 1 Grupo de recursos * ① Crear nuevo Detalles de la base de datos Indique la configuración necesaria para esta base de datos, incluida la selección de un servidor lógico y la configuración de los recursos de proceso y almacenamiento. IMDB Nombre de la base de datos * Servidor * ① (nueva) server-imbdb (East US) Crear nuevo O Sí O No ¿Quiere usar un grupo elástico de SQL? Proceso y almacenamiento * ① Básico Almacenamiento: 2 GB Configurar base de datos Redundancia del almacenamiento de copias de seguridad Elija el modo de replicación de las copias de seguridad de PITR y LTR. La restauración geográfica o la posibilidad de recuperación tras una interrupción regional solo están disponibles si se ha seleccionado el almacenamiento con redundancia geográfica. Almacenamiento de copias de seguridad con redundancia local Redundancia de almacenamiento de copia de seguridad ① Almacenamiento de copias de seguridad con redundancia de zona. Almacenamiento de copias de seguridad con redundancia geográfica

En las configuraciones de la implementación de la base de datos para la creacion de IMDB, utilizaremos la base por default de Azure.

Crear base de datos SQL

Microsoft

Básico Redes Seguridad Configuración adicional Etiquetas Revisar y crear

Personalice parámetros de configuración adicionales, incluidos los datos de muestra y la intercalación.

Origen de datos

Empiece con una base de datos vacía, restaure otra a partir de una copia de seguridad, o bien seleccione datos de muestra para rellenar una nueva.

Usar datos existentes *

Intercalación de base de datos

La intercalación de la base de datos define las reglas que ordenan y comparan los datos, y no se puede cambiar después de crear la base de datos. La intercalación de la base de datos predeterminada es SQL_Latin1_General_CP1_CI_AS. Más información 🗹

Intercalación * ① SQL_Latin1_General_CP1_CI_AS ✓

Buscar una intercalación

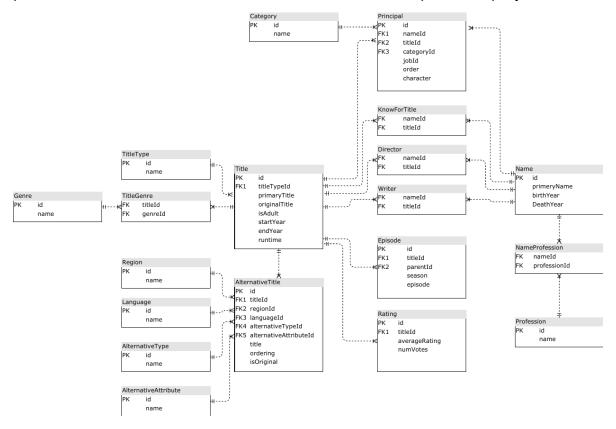

Ventana de mantenimiento

Seleccione la ventana de mantenimiento que prefiera en el menú desplegable. Tenga en cuenta que, durante un evento de mantenimiento, Azure SQL Database conserva toda su disponibilidad y accesibilidad, pero algunas de las actualizaciones de mantenimiento, para su aplicación, requieren efectuar una conmutación por error, por lo que Azure desconecta las instancias de SQL DB durante un breve período. Si la base de datos forma parte de un grupo elástico, se aplicará la configuración de mantenimiento de dicho grupo elástico. Más información

Ventana de mantenimiento

Valor predeterminado del sistema (de 17:00 a 8:00)

Luego de haber creado nuestro servidor de Base de datos en la nube procederemos a crear nuestro modelo relacional a tomar para este proyecto.

Script

Carga de datos

Para la inserción de datos dentro de IMDB se procedio a tomar los siguientes elementos correspondientes a cada tipo según el campo requerido para hacer alución a la carga de datos y establecerlos dentro de cada uno.

Modelo de datos en NETFLIX

Tabla	Descripción
Genre	En esta tabla se almacenan los géneros posibles de algún título
TitleType	Se almacenan los posibles tipos de un título. Ej. Show, película, serie, etc.
Title	En esta tabla se almacena la información relevante de un título y en ella también hace referencia con llave foránea hacia los posibles tipos de títulos y géneros que pueda clasificarse un mismo título. El valor de esta llave primaria es exactamente igual a la de IMDB para poder vincular su rating
Title_Genre	A esta tabla caen todos los géneros posibles en los que pueda clasificarse un mismo título.
Episode	En dado caso el título sea una serie, acá se encuentra a detalle su único o varios episodios correspondientes a un mismo título
Person	Esta tabla almacena todas las personas que pueden verse enrrollada en algún título
Role	Acá se especifican los posibles roles que las personas pueden ejercer. Éstos pueden ser actor, actriz, director o escritor
Crew	Acá se definen todas las personas y rol que ejercen en un mismo título
